<b>Description</b> My company uses a jabber server for iChat. I want to use your product on my Android device. I have the setup matching our login settings for iChat, and then our jabber server gets the following error:  error: SSL handshake error (error:140760FC:SSL routines:SSL23_GET_CLIENT_HELLO:unknown protocol)  I'm not sure if this is because our server is requiring a specific protocol or what. If it is a server issue, what is necessary to allow for your application to connect to our server? Thanks.	
<b>Related issues:</b> Related to Bug #311: I need force old 5223 ssl support <b>Rejected</b> <b>10/29/2010</b>

I think your server use the old SSL method. This method is not supported by Beem however you can check issue [#311](#) which contains a patch to enable it.
